Risk Memo: Crowded-Trade Signature Screen

To: Prime brokerage / multi-strategy risk desk | From: Shaswat Sharma | Re: Filers sharing the Situational Awareness pre-collapse signature

Recommendation

Flag Symmetry Peak Management LLC (CIK 0001389234) for a closer position-level liquidity and leverage review. Its 13F-disclosed concentration index rose from 0.103 to 0.237 in the most recent quarter -- a larger single-quarter jump than Situational Awareness's own pre-collapse move (0.070 to 0.176). It breaches the concentration LEVEL and TREND axes; it does NOT breach the multi-name crowding axis (it holds 1 of the 4 tracked names, not 2+). No other filer in the 12 screened breaches 2 of the 3 risk axes established below.

Basis for the Screen

A single static concentration threshold does not work. Tested out-of-sample against two historical blow-ups (Melvin Capital pre-GME, Tiger Global pre-2022) and two large diversified controls (Berkshire Hathaway, Renaissance Technologies), a naive Herfindahl-index cutoff misclassifies: Berkshire's own concentration (0.064) exceeds Melvin's pre-blowup figure (0.027), because Melvin's real risk sat in undisclosed swaps and short positions -- the same structural blind spot documented for Archegos Capital (also excluded from this project's back-test for the same reason: it filed no 13F at all). The screen below therefore requires a filer to breach at least 2 of 3 independent axes before flagging:

Axis	Threshold	Rationale
Concentration level	Herfindahl index > 0.10	Midpoint of Situational Awareness's own Q1->Q2 2026 run-up (0.070 -> 0.176)
Concentration trend	> +0.03 change, single quarter	SA moved +0.106 in one quarter; a fast rise, not just a high level, is the signal
Multi-name crowding	Holds >= 2 of 4 tracked illiquid names	Concentration in ANY one name is common; overlap across the SAME illiquid names is not

Screening Universe

4 CUSIPs, chosen as the least-liquid or highest-conviction names in Situational Awareness's own final disclosed book (Core Scientific, Applied Digital, IREN, Nebius). 12 filers, prioritised by how many of the 4 they co-hold, out of 51 distinct filers found via SEC EDGAR full-text search across all four CUSIPs. This is a scoped screen, not an exhaustive market sweep -- absence of a flag means not found within this stated scope, not the absence of risk in the broader market.

Caveat -- what actually separates flagged from unflagged

Gullane Capital, LLC shows extreme single-name concentration (Herfindahl index 0.875) but is not flagged, because it breaches only 1 of the 3 axes: its concentration is extreme yet essentially unchanged quarter-over-quarter (trend -0.003), so it fails the trend axis. Note that Symmetry Peak -- the filer that IS flagged -- also holds only 1 of the 4 tracked names, so multi-name crowding is not the separator between them; concentration TREND is. Neither filer breaches the crowding axis. Static single-name concentration is a real risk, but a structurally different one this screen was not designed to catch.

Scope and Limits

This is risk geometry, not a forecast. No claim here asserts that any named filer will experience losses or distress. Like Situational Awareness's own disclosed book, this screen sees only 13F-reportable long equity and listed options -- it cannot see a flagged filer's actual leverage, short book, or off-exchange exposure, which is precisely the blind spot that obscured the original case this project is built on. A signature match on the axes above is a prompt for a closer, non-public review -- not a substitute for one.
